**Summary :** Free vector calculus in regional development analysis pdf download - methods used for regional development analysis are employed mainly to make forecasts and comparisons forecasting models of various types e g econometric models are usually used for forecasting recently vector-autoregressive models var have become popular these models were proposed by sims in 1980 on the contrary taxonomic methods that are in the center of attention as far as the present publication is concerned are most often employed to make comparisons linear ordering methods including standard methods are the most popular among taxonomic methods they are based on different distance and similarity measures which leads to the fact that they do not always provide reliable information when for example one construes the standard for a base year and then compares it with data for other years it may turn out that the measure determined will have worse values than the standard for a real object region micro region although this object is better from the standard hence one must look for new methods employed in regional development analysis or improve hitherto existing ones in such a way so that information obtained reflects the reality to a larger extent the main aim of the present publication is to work out methodological basis for regional development analysis based on vector calculus together with assumptions about computer system supporting the implementation of the method suggested
